Sustainable and extremely powerful

gear oils are based on the latest generation of base oils. The polyalphaolefins used in the oils are produced with metallocene catalyst technology, which enables a high viscosity with a narrow distribution of the molecular weight and a very even structure without short side chains. Together with a modern high-performance additive package, the properties achieved far exceed most polyalphaolefin-based gear oils offered on the market.

Extremely low tendency to foam

The fully synthetic high-performance **Berusynth GPX series** The special formulation of the Berusynth GPX series ensures improved oxidation resistance, enables longer oil change intervals, reduces the friction value in tooth contact and decreases power losses. With these trend-setting highperformance gear oils, BECHEM supports the sustainable, resource-efficient operation of gear boxes and systems and a reduced carbon footprint. The Berusynth GPX series is approved by gear manufacturer Flender.

Advantages of Berusynth GPX gear oil

- Extremely high viscosity index and therefore thicker lubricating film at higher operating temperatures
- Extremely low tendency to foam
- · High working temperature range
- Excellent deep temperature properties
- Very high oxidation stability and therefore longer oil change intervals
- Improved protection against wear and seizing
- Very high resistance to micro-pitting
- · Low friction value resulting in lower power loss
- Improved filterability

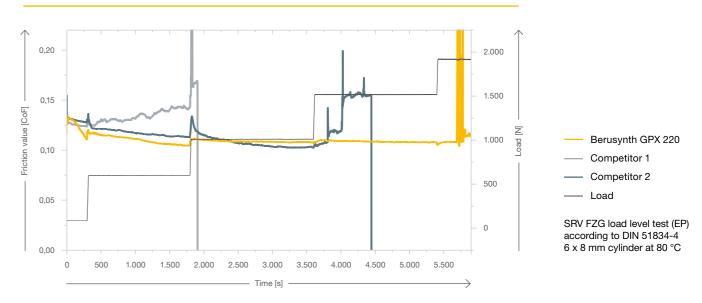

Excellent wear protection

The threshold for the wear of rolling elements in the FAG FE 8 test for CLP gear oils according to DIN 51517-3 is only 30 mg. The products of the Berusynth GPX series achieve a particularly excellent wear of rolling elements of \leq 8 mg.

More stable lubricating film and lower friction value

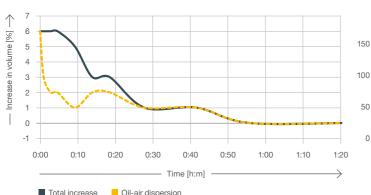

The oils in the Berusynth GPX series achieve a better DIN 51517-3: 2018-09 CLP result compared with similarly structured competitor oils • ANSI/AGMA 9005-F16: 2016 AS in the SRV FZG load level test according to DIN 51834-4. ISO 12925-1: 2018-01 CKD At 80 °C and with friction pairing cylinder (6 x 8 mm) • ISO 12925-1-2018-01 CKSMP against lapped plate, "gluttons" occur with competitor oils in GB 5903: 2011 L-CKD ISO VG 220 at a lower force and the lubricating film breaks down after a shorter running time. Berusynth GPX 220 achieves a longer running time, withstands higher loads and achieves a lower friction value over the entire running time.
